User Stories

- As a librarian, I want to design and implement an accessible and intuitive website that will display a variety of books and sort them based on different filters with the ability of checking out selected books.

    - As a customer/user, the website allows them to:
        - Create an account
        - Login
        - Search for a book
        - Checkout a book
        - Return a book
        - Look up author information
        - Receive recomendations

    - As a book, each book will:
        - be able to be loaded as a thumbnail on a page
        - once selected, a new view/page displays the book information including its name, book cover, author, genre, stock and a checkout button
        - Once rented out, the stock for the selected book will change accordingly
        - Once returned, the stock for the selected book will change accordingly
